## EMERGING METHODS FOR EARLY DETECTION OF FOREST FIRE

| Date          | 16 October 2022  |
|---------------|--|
| Team ID       | PNT2022TMID30863   |
| Project Name  | Project - Emerging Methods for Early Detection of Forest Fires |
| Maximum Marks | 2 Marks  |

## **PROPOSED SOLUTION:**

Technologies, such as drones, robots, and satellites, are all being used to detect, impede, and douse fires. The user interacts with a web camera to read the video. Once the input image from the video frame is sent to the model, if the fire is detected it is showcased on the console, and alerting sound will be generated and an alert message will be sent to the Authorities.

| PARAMETERS                 | DESCRIPTIONS                                |
|----------------------------|---|
| Problem Statement          | A forest fire risk prediction algorithm,    |
|                            | based on support vector machines, is        |
|                            | presented. The algorithm depends on         |
|                            | previous weather conditions in order to     |
|                            | predict the fire hazard level of a day.     |
| Idea (feasibility of idea) | Use computer vision methods for             |
|                            | recognition and detection of smoke or       |
|                            | fire, based on the still images or the      |
|                            | video input from the drone cameras          |
| Novelty                    | Real time computer program detect           |
|                            | forest fire in earliest before it spread to |
|                            | larger area.                                |
| Social impact              | Blocked roads and railway lines,            |
|                            | electricity, mobile and land telephone      |
|                            | lines cut, destruction of homes and         |
|                            | industries.                                 |
| Business Model             | The proposed method was implemented         |
|                            | using the Python programming language       |
|                            | on a Corei3or greater.                      |

| Scalability | Computer vision models enable land       |
|-------------|--|
|             | cover classification and smoke detection |
|             | from satellite and ground cameras.       |
